

Name	Alice (sender)	Bob (Receiver)
1) Public Keying	$K_B(n,d) = (55, 27)$ $K_B(n,e) = (55, 3)$	$K_B(n,d) = (35, 29)$ $K_B(n,e) = (35, 5)$
2) Hash Function	$H(x) = x \bmod 13$	$H(x) = x \bmod 13$
3) Symmetric Keying	$K_S = 5$	How to get it?
4) Message	$m = 17$	How to get it?

Alice (sender):

Step#	Description				
1	Get message $m \rightarrow m=17$				
2	Hash message $\rightarrow H(m)=17 \% 13 = 4$				
3	Encrypt Hashed message $\rightarrow 4^d \bmod n = 4^{27} \% 55 = 49$				
4	Integrate w/ digital signature \rightarrow <table><tr><td>m</td><td>dS</td></tr><tr><td>17</td><td>49</td></tr></table>	m	dS	17	49
m	dS				
17	49				
5	Generate Symmetric Key $\rightarrow K_S = 5$				
6	Encrypt Key w/ Bob's public key: $5^5 \bmod 35 = 10$				
7	Encrypt message from 4 w/ Key: <table><tr><td>22</td><td>54</td></tr></table>	22	54		
22	54				
8	Integrate with encrypted msg: $K_S(m)$ $K_S(K_A(H(m)))$ $K_A(K_S)$ <table><tr><td>22</td><td>54</td><td>10</td></tr></table>	22	54	10	
22	54	10			
9	Send step 8's result to Bob				

Receiver (Bob):

	Receiver (Bob):	$(K_S(m))$ $(K_S(K_A(H(m))))$ $(K_A(K_S))$			
1	Receive data from Alice:	<table border="1"><tr><td>22</td><td>54</td><td>10</td></tr></table>	22	54	10
22	54	10			
2	Split session key/message:	<table border="1"><tr><td>22</td><td>54</td><td>10</td></tr></table>	22	54	10
22	54	10			
3	Decrypt msg w/ Bob's private key ^{Bob's private key:}	$K_B(10) = 10^{29} \% 35 = 5$			
4	Decrypt msg w/ session key:	<table border="1"><tr><td>17</td><td>49</td></tr></table>	17	49	
17	49				
5	Split msg & DS:	17, <table border="1"><tr><td>49</td></tr></table>	49		
49					
6	Hash Msg:	$17 \% 13 = $ <table border="1"><tr><td>4</td></tr></table>	4		
4					
7	Decrypt Signature w/ Alice's Public Key:	$P_A(55, 3) \rightarrow 49^3 \bmod 55 = $ <table border="1"><tr><td>4</td></tr></table>	4		
4					
8	Compare hashes from 6 & 7:	$4 = 4$; They're equal			
9	If hashes are equal, msg is okay:	Pass integrity check; msg=okay			

3) Receiver Side
